

# Sludge Rx™

The Newest Technology in Biological Sludge Reduction

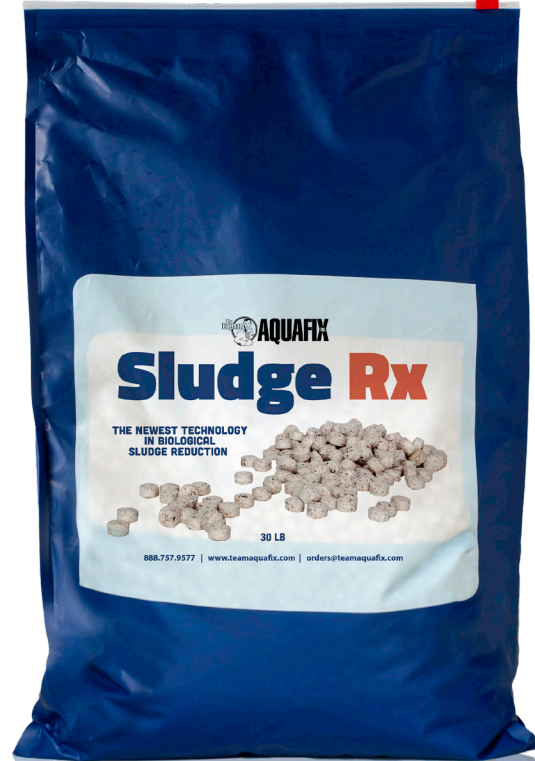

Sludge Rx™ will turn 1 foot of nutrient-filled sludge into a few inches of bacterial biomass. Designed for all types of wastewater facilities, these tablets lower effluent TSS, ammonia, phosphate, and improves effluent pH.

Sludge Rx tablets contain The Diversiform Blend™: a synergistic blend of bacterial cultures and biostimulants that dramatically reduces sludge and nutrients in wastewater lagoons. The components of Sludge Rx stimulate bacterial growth in the sludge layer and degrade insoluble forms of BOD which results in lower effluent ammonia and phosphate. While the tablets degrade sludge, they go after the root causes of water quality issues that originate on the bottom.

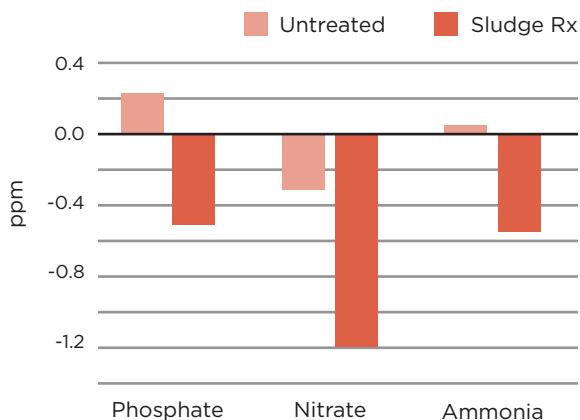

## Tablet Technology:

Unlike other bacterial amendments, the dense tablets of Sludge Rx sink deep into the sludge and deliver bacteria and biostimulants directly where they are needed. With all the ingredients remaining in the area of treatment, these tablets are the most efficient possible sludge reduction approach. This means application can happen as infrequently as once per month.
